

POTENTIAL IMPACTS OF GLOBAL CHANGES ON A BRAZILIAN CONTINENTAL SHELF AND SLOPE COMMUNITY

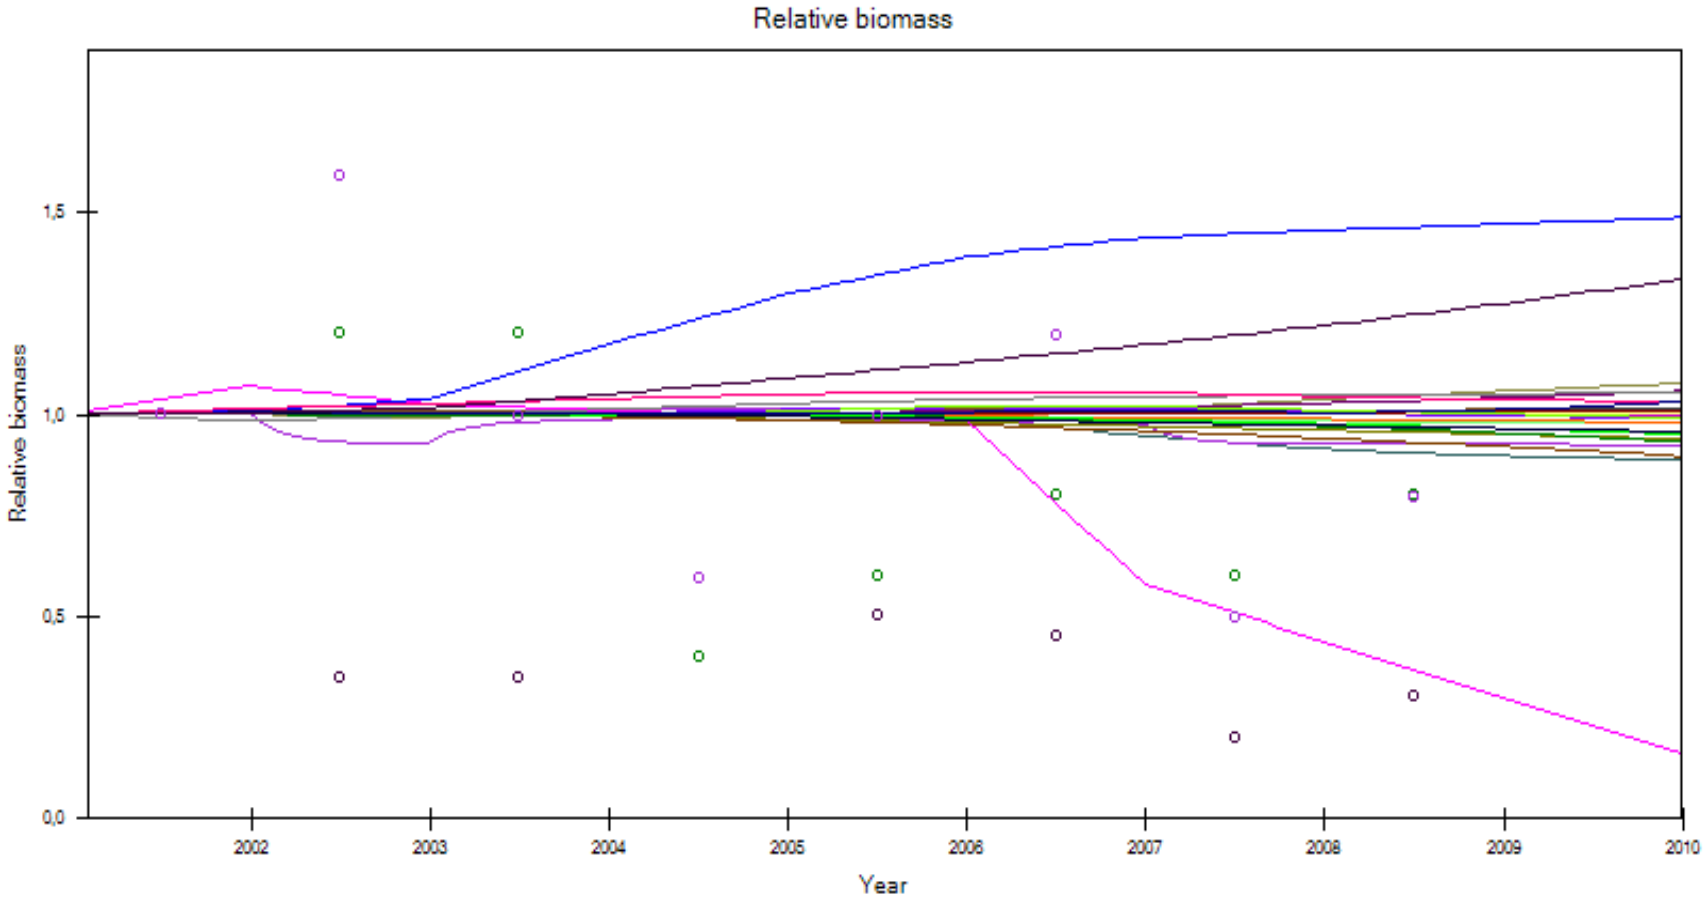

MARCELA C. NASCIMENTO; THOMAS A. OKEY & GONZALO VELASCO

We build the model for Southeastern Brazilian Bight (Nascimento *et al.* 2012)

We built a data-series of fishing since 2001 until 2007, but the fisheries data are not very accurate. Some species are overexploited and had drastic reduction in their biomass in this period.

The model not adjusted with the real points of biomass.

We built an exploratory model of global change: three scenarios of changes in primary production, and three global changes scenario of lower (1.4°C) high (5.8°C) and intermediate (3.6°C) temperature increases.
